De Pere Mulva Cultural Center Traffic Impact Analysis

Executive Summary

Overview

This Traffic Impact Analysis (TIA) is an effort to evaluate the potential traffic impacts as a result of the proposed Mulva Cultural Center development. The proposed development will be in the SE quadrant of the roundabout at Main Avenue and S. Broadway and will occupy what is currently two separate parcels – an undeveloped parcel on the west side of Wisconsin Street and Notre Dame Middle School on the east side of Wisconsin Street. This segment of Wisconsin Street between the two parcels will be eliminated and Notre Dame Middle School will be moving to a new location. See the Project Location Map and Proposed Development Map in Appendix A for details.

The hours of operation of the proposed Mulva Cultural Center will be from 9:00 AM to 6:00 PM, six or seven days a week with occasional private receptions in the evening. Included within the center will be a 224-seat auditorium; a 2,730 square foot, 71-seat restaurant; two classrooms totaling 1,700 square feet and seating 48; a 10,180 square foot exhibit space; and an 1,840 square foot gift shop.

The study area was defined collectively by the developer, the City and JT Engineering. This report details the analysis performed to evaluate the potential impacts to the following intersections as a result of the proposed Mulva Cultural Center development:

- 1) S. Broadway & Lewis Street
- 2) S. Broadway & Merrill Street
- 3) Merrill Street & Chicago Street
- 4) Chicago Street & S. Wisconsin Street
- 5) George Street & Michigan Street
- 6) Lewis Street & Erie Street

Evaluation

The intersections were analyzed using Synchro software. Analysis times included the AM, Midday, PM, and Saturday peak periods for the 2020 Existing Conditions scenario plus the Midday, PM, and Saturday peak periods for the following scenarios:

- Future year 2021 Build (Total Traffic) Conditions
- Future year 2021 Build (Total Traffic) Conditions with right-in/right-out only access westbound at the intersection of S. Broadway and Lewis Street

The existing base traffic volumes used were generated from the video counts taken utilizing Miovision cameras. The videos also allowed for an analysis of existing conditions and driver behavior at the intersections.

The 2021 projected traffic volumes were based on a growth rate of approximately 0.5% per year. This was based on the WisDOT Planning Forecast Unit data for the Hwy 32 crossing of the Fox River and Hwy 57 (Broadway). The 2021 build scenario included the traffic expected to be generated by the proposed development, which was determined based on the number of available parking

spaces. See Appendix A for the Proposed Development Map which provides details for the on-site parking and driveway locations.

There was no commonality between the Notre Dame Middle School TIA and the Mulva Cultural Center TIA so therefore changes resulting from the school moving to a new location were not incorporated into the report.

Summary

The analysis of the Existing Conditions shows that all six intersections operate at Level of Service (LOS) A during the AM, midday, PM, and Saturday peak periods. All movements operate at LOS C or better.

The analysis of the Build Conditions shows that all six intersections operate at LOS A during the midday, PM, and Saturday peak periods. All movements operate at LOS C or better during the midday and Saturday peak periods. During the PM peak period, the stop-controlled northbound approach at the intersection of Michigan Street and George Street operates at a LOS D and the stop-controlled westbound approach at the intersection of S. Broadway and Lewis Street operates at a LOS F based on HCM two-way stop-controlled (TWSC) delay output.

During the Existing AM peak, review of the Miovision videos showed network operations were largely affected by the roundabout at Main Avenue and S. Broadway. Since this intersection was not part of the study area, these impacts were not seen through the Synchro analysis. Northbound traffic from the roundabout was viewed queueing back on S. Broadway through the intersection of S. Broadway and Lewis Street for the entire observed 15-minute peak and at times the queue reached back to the center of the intersection of S. Broadway and Merrill Street. Although queued traffic left gaps at the intersection of S. Broadway and Lewis Street, this poses a safety issue for westbound left-turning traffic due to the inability to see past the northbound queued traffic to observe vehicles coming southbound in the right lane.

During the Existing PM peak, review of the Miovision videos showed similar effects from the roundabout at Main Avenue and S. Broadway, including long northbound queues through the intersection of S. Broadway and Lewis Street posing a safety issue for left-turning traffic. The 95th percentile queue length for the southbound through/left movement at the intersection of S. Broadway and Lewis Street, as reported from SimTraffic, extends 170 feet. This is within 12 feet of the crosswalk on the south leg of the roundabout at Main Avenue and S. Broadway. During the 2021 PM peak under Build conditions, the 95th percentile queue length at this same location extends 204 feet and the queue would now back up through the crosswalk. The proximity of these two intersections, in conjunction with southbound queuing at Lewis Street, poses a safety issue for westbound left-turning traffic at Lewis Street due to the inability to easily see past the queuing to observe the large volume of southbound traffic coming from the roundabout in the right lane. It also poses a safety issue for southbound traffic exiting the roundabout with the potential lane changes required to avoid the stopped traffic wishing to turn left at Lewis Street. And finally, it poses a safety issue for pedestrians wishing to cross the south leg of the roundabout.

To address the proximity of the intersection of S. Broadway and Lewis Street with the roundabout at Main Avenue, an analysis was completed for the PM peak with the westbound movement on Lewis

Street modified to right-in/right-out only. Background and development traffic were redistributed to surrounding intersections. The analysis shows that all six intersections operate at LOS A during the PM peak period. All movements operate at LOS C or better except for the northbound approach at the intersection of Michigan Street and George Street which operates at a LOS D. Delay for this stop-controlled northbound movement on Michigan Street increased by less than 5 seconds with the additional traffic from the redistribution.

The concept of modifying the westbound movement on Lewis Street to right-in/right-out is recommended. The Miovision video at the intersection of S. Broadway and Lewis Street showed that during peak periods, the westbound movement is already operating as a de facto right-out due to the proximity of Lewis Street to the roundabout at Main Avenue. Drivers are choosing or have learned to avoid attempts at a left-out movement. The overall data shows only one vehicle making a left turn from Lewis Street onto S. Broadway on a weekday between the hours of 11:00 AM – 6:00 PM, none during AM or PM peak times. On Saturday, two vehicles made this left turn between 11:00 AM – 3:00 PM. Making this modification will provide for increased overall network safety by eliminating both the southbound queue and the left turn movements. Left turning vehicles are redistributed to the traffic signal at S. Broadway and Merrill Street to the south or become right turns at the intersection of Michigan Street and George Street resulting in safer access to the desired corridors.

There are no other improvements required to provide LOS D or better for all traffic movements.

De Pere Mulva Cultural Center Traffic Impact Analysis

Background

The proposed development will be in the SE quadrant of the roundabout at Main Avenue and S. Broadway and will occupy what is currently two separate parcels – an undeveloped parcel on the west side of Wisconsin Street and Notre Dame Middle School on the east side of Wisconsin Street. This segment of Wisconsin Street between the two parcels will be eliminated and Notre Dame Middle School will be moving to a new location. See Appendix A for a Proposed Development Map.

The existing intersection details for the analyzed locations are as follows:

- 1) The intersection of S. Broadway and Lewis Street is a T intersection with stop-control westbound on Lewis Street. There is currently full access to/from Lewis Street.
- 2) The intersection of S. Broadway and Merrill Street is signalized and currently programmed to run actuated-coordinated during peak times and fully actuated during off-peak times.
- 3) The intersection of Merrill Street and Chicago Street is a two-way stop-controlled intersection with the stop control northbound and southbound on Chicago Street.
- 4) The intersection of Chicago Street and S. Wisconsin Street is a T intersection with stop-control southbound on S. Wisconsin Street.
- 5) The intersection of George Street and Michigan Street is two-way stop-controlled with the stop control northbound and southbound on Michigan Street.
- 6) The intersection of Lewis Street and Erie Street is two-way stop-controlled with the stop control eastbound and westbound on Lewis Street.

A project location map is included in Appendix A.

Purpose of this Study

This Traffic Impact Analysis (TIA) is an effort to evaluate the potential impacts to the above intersections as a result of the proposed Mulva Cultural Center development. The results of the study will be recommendations on traffic control, intersection geometrics, turn bay creation and any other improvements required to provide Level of Service (LOS) 'D' or better for all traffic movements. The intersection of S. Broadway and Lewis Street will be evaluated with right-in/right-out only access westbound from Lewis Street.

Analysis Approach

The project intersections were analyzed using Synchro software. The results generated from this software utilize the Two Way Stop Control (TWSC) and Signalized capacity methodology from the Transportation Research Board Highway Capacity Manual (HCM) within the Synchro software. Synchro output includes overall intersection and approach delays. SimTraffic was used to determine queue lengths and individual vehicle delays.

The existing base traffic volumes were generated from the video counts taken between Saturday, February 8 and Saturday, February 15, 2020 using Miovision cameras. See Appendix C for existing peak hour traffic counts. The videos allowed for an analysis of existing conditions and driver behavior at the intersections. Analysis times included the AM peak (based on the peak 15-minute

period from 7:45 AM – 8:00 AM), Midday peak (11:45 AM – 12:45 PM), PM peak (4:30 PM – 5:30 PM), and Saturday peak (11:45 AM – 12:45 PM) periods for the 2020 Existing scenario. The hours of operation of the Mulva Cultural Center are outside of the AM peak and therefor the Midday peak was analyzed in lieu of the AM peak for the build scenario. The detailed Traffic Analysis output is included in Appendix D.

The 2021 projected traffic scenario was based on a growth rate of approximately 0.5% per year. This was based on the WisDOT Planning Forecast Unit data for the Hwy 32 crossing of the Fox River and Hwy 57 (Broadway). The 2021 build scenario included the traffic expected to be generated by the proposed development, which was determined based on the number of available parking spaces. See Appendix A for the Proposed Development Map which provides details for the on-site parking and driveway locations. See Appendix C for Year 2021 traffic volumes and Appendix B for the data used from the ITE Trip Generation manual.

Proposed Development

The proposed development in the SE quadrant of the roundabout at Main Avenue and S. Broadway is the Mulva Cultural Center. The hours of operation will be from 9:00 AM to 6:00 PM, six or seven days a week with occasional private receptions in the evening. Included within the center will be a 224-seat auditorium; a 2,730 square foot, 71-seat restaurant; two classrooms totaling 1,700 square feet and seating 48; a 10,180 square foot exhibit space; and an 1,840 square foot gift shop.

Trip generation was determined based on discussions with the developer: parking is expecting to be accommodated on-site with 125 available stalls; trips to the restaurant and gift shop will be 100% linked to other on-site uses; and no pass-by trips are expected. Peak hour trip generation arrival and departure percentages were determined using ITE methodology to the extent possible plus knowledge of the development. Trips were distributed based on directional distributions at the roundabout determined from data obtained from WisDOT. See Appendix C for traffic counts and turning movement data.

Intersection Evaluation

Traffic Operations

Intersection operations are defined by Level of Service (LOS), which is a quantitative measure that refers to the overall quality of flow at an intersection ranging from very good (LOS A) to very poor (LOS F). For the purpose of this study, LOS D was used to define acceptable peak hour operating conditions. Descriptions of the various levels of service are as follows:

- LOS A is the highest level of service that can be achieved. Under this condition, intersection approaches appear to be quite open, turning movements are easily made, and nearly all drivers find freedom of operation. At signalized and unsignalized intersections, average delays are less than 10 seconds.
- LOS B represents stable operation. At signalized intersections, average vehicle delays are 10 to 20 seconds. At unsignalized intersections, average delays are 10 to 15 seconds.
- LOS C still represents stable operation, but periodic backups of a few vehicles may develop behind turning vehicles. Most drivers begin to feel restricted, but not objectionably so. At

signalized intersections, average vehicle delays are 20 to 35 seconds. At unsignalized intersections, average delays are 15 to 25 seconds.

- LOS D represents increasing traffic restrictions as the intersection approaches instability. Delays to approaching vehicles may be substantial during short peaks within the peak period, but periodic clearance of long lines occurs, thus preventing excessive backups. At signalized intersections, average vehicle delays are 35 to 55 seconds. At unsignalized intersections, average delays are 25 to 35 seconds.
- LOS E represents the capacity of the intersection. At signalized intersections, average vehicle delays are 55 to 80 seconds. At unsignalized intersections, average delays are 35 to 50 seconds.
- LOS F represents jammed conditions where the intersection is over capacity and acceptable gaps for unsignalized intersections in the mainline traffic flow are minimal. At signalized intersections, average vehicle delays exceed 80 seconds. At unsignalized intersections, average delays exceed 50 seconds.

Overall intersection and approach LOS were reported from Synchro. Queue lengths and delay per vehicle were reported from SimTraffic. The results of the analysis for the six project intersections detailed in Appendix D are as follows:

2020 Existing Conditions

Details on the existing geometrics for the six project intersections are as follows:

- 1) S. Broadway and Lewis St. currently consists of a through lane and a shared through/right lane in the northbound direction, a through lane and a shared left/through lane in the southbound direction, and a shared left/right lane in the westbound direction.
- 2) S. Broadway and Merrill St. consists of a shared left/through lane and a shared through/right lane in the northbound and southbound directions, a shared left/through/right in the eastbound direction, and a shared left/through lane and right turn only lane in the westbound direction.
- 3) Merrill St. and Chicago St. consists of a shared left/through/right lane in all four directions.
- 4) Chicago St. and S. Wisconsin St. consists of a shared through/right in the northbound direction, a shared left/through in the southbound direction, and a shared left/right in the westbound direction.
- 5) George St. and Michigan St. consists of a shared left/through/right lane in all four directions.
- 6) Lewis St. and Erie St. consists of a shared left/through/right lane in all four directions.

The analysis of the Existing Conditions shows that all six intersections operate at LOS A during the AM, midday, PM, and Saturday peak periods. All movements operate at LOS C or better. See Table 1 for details.

Note: Delay is reported in seconds

During the existing AM peak, review of the Miovision videos showed network operations were largely affected by the roundabout at Main Avenue and S. Broadway. Since this intersection was not part of the study area, these impacts were not seen through the Synchro analysis. The following issues were noted:

- Northbound traffic from the roundabout queued through the intersection of S. Broadway and Lewis Street during the entire observed 15 minute peak but the queued traffic allowed westbound left-turning traffic through by not blocking the intersection and westbound right-turning traffic to enter in a zipper merge fashion.
- Northbound traffic from the roundabout at times queued back to the center of the intersection of S. Broadway and Merrill Street, blocking both left and right turns from Merrill Street.

- The westbound right turn at S. Broadway and Merrill Street queued back to Chicago Street several times during the 15-minute peak.
- Westbound traffic from the roundabout queued back to the intersection of George Street and Michigan Street at times during the 15-minute peak but did not block the intersection.

During the Existing PM peak, review of the Miovision videos showed similar effects from the roundabout at Main Avenue and S. Broadway, including long northbound queues through the intersection of S. Broadway and Lewis Street posing a safety issue for left-turning traffic. The 95th percentile queue length for the southbound through/left movement at the intersection of S. Broadway and Lewis Street, as reported from SimTraffic, extends 170 feet (approximately 7 vehicles) with a delay of less than 10 seconds per vehicle. This is within approximately 12 feet of the crosswalk on the south leg of the roundabout at Main Avenue and S. Broadway.

2021 Build Conditions

Year 2021 build conditions include a 0.5% growth rate in background traffic plus the additional traffic from the development. Parking is expected to be accommodated on-site with the maximum additional trips totaling 125. The ITE Trip Generation Manual site code for Museums provided PM and Saturday peak in and out percentages. The Saturday peak percentages were also applied to the midday peak. The ITE Trip Generation rate for a Museum is much lower than the parking capacity which is why it was not used for the analysis. See Appendix B for details.

The analysis of the Build Conditions shows that all six intersections operate at LOS A during the midday, PM, and Saturday peak periods. All movements operate at LOS C or better during the midday and Saturday peak periods. During the PM peak period, the northbound approach at the intersection of Michigan Street and George Street operates at a LOS D with a total delay of 25.6 seconds based on HCM TWSC delay output. The 95th percentile queue length for the northbound movement, as reported from SimTraffic, shows approximately 2 vehicles with a delay of less than 15 seconds per vehicle. The westbound approach at the intersection of S. Broadway and Lewis Street operates at a LOS F with a total delay of 115.6 seconds based on HCM TWSC delay output. The 95th percentile queue length for the westbound movement, as reported from SimTraffic, shows approximately 6 vehicles with a delay of 71 seconds per vehicle. See Table 2 for details on LOS and delay.

Lewis St. & Erie St.	TWSC										

Note: Delay is reported in seconds

During the 2021 PM peak build conditions, the 95th percentile queue length for the southbound through/left movement at the intersection S. Broadway and Lewis Street, as reported from SimTraffic, extends 204 feet (approximately 8 vehicles) with a delay of less than 10 seconds per vehicle. Although this is only one additional vehicle over existing conditions, the queue would now back up through the crosswalk on the south leg of the roundabout at Main Avenue and S. Broadway.

Given the large volume of southbound traffic exiting the roundabout during the PM peak and the potential lane changes to avoid stopped traffic wishing to turn left at Lewis Street, plus the inability for westbound left-turning traffic on Lewis Street to see past the southbound left turn queue to observe vehicles traveling southbound in the right lane, this area was further analyzed.

2021 Build Conditions with Right-In/Right-Out Only Access at S. Broadway & Lewis Street

To address the proximity of the intersection of S. Broadway and Lewis Street with the roundabout at Main Avenue, an analysis was completed for the PM peak with the westbound movement on Lewis Street modified to right-in/right-out only. Background and development traffic were redistributed to surrounding intersections. The analysis shows that all six intersections operate at LOS A during the PM peak period. All movements operate at LOS C or better except for the northbound movement at the intersection of Michigan Street and George Street which operates at a LOS D with a total delay of 28.5 seconds based on HCM TWSC delay output. The 95th percentile queue length for the northbound movement, as reported from SimTraffic, shows between 2 and 3 vehicles with a delay of less than 20 seconds per vehicle. The existing roadway network of local streets and multiple connections to George Street would allow drivers to choose an alternate access location if delays are found unacceptable based on driver perception. See Table 3 for details on LOS and delay.

Table 3

Location	Intersection Control	Build PM Peak - RIRO at S. Broadway & Lewis St.

Summary

The analysis of the Existing Conditions shows that all six intersections operate at LOS A during the midday, PM, and Saturday peak periods. All movements operate at LOS C or better.

The analysis of the Build Conditions shows that all six intersections operate at LOS A during the midday, PM, and Saturday peak periods. All movements operate at LOS C or better during the midday and Saturday peak periods. During the PM peak period, the stop-controlled northbound approach at the intersection of Michigan Street and George Street operates at a LOS D and the stop-controlled westbound approach at the intersection of S. Broadway and Lewis Street operates at a LOS F based on HCM TWSC delay output. This is an increase over existing conditions of 7.5 seconds northbound on Michigan Street and 103 seconds westbound on Lewis Street.

During the Existing AM peak, review of the Miovision videos showed network operations were largely affected by the roundabout at Main Avenue and S. Broadway. Since this intersection was not part of the study area, these impacts were not seen through the Synchro analysis. Northbound traffic from the roundabout was viewed queueing back on S. Broadway through the intersection of S. Broadway and Lewis Street for the entire observed 15-minute peak and at times the queue reached back to the center of the intersection of S. Broadway and Merrill Street. Although queued traffic left gaps at the intersection of S. Broadway and Lewis Street, this poses a safety issue for westbound left-turning traffic due to the inability to see past the northbound queued traffic to observe vehicles coming southbound in the right lane.

During the Existing PM peak, review of the Miovision videos showed similar effects from the roundabout at Main Avenue and S. Broadway, including long northbound queues through the intersection of S. Broadway and Lewis Street posing a safety issue for left-turning traffic. The 95th percentile queue length for the southbound through/left movement at the intersection of S. Broadway and Lewis Street, as reported from SimTraffic, extends 170 feet. This is within 12 feet of

the crosswalk on the south leg of the roundabout at Main Avenue and S. Broadway. During the 2021 PM peak under Build conditions, the 95th percentile queue length at this same location extends 204 feet and the queue would now back up through the crosswalk. The proximity of these two intersections, in conjunction with southbound queuing at Lewis Street, poses a safety issue for westbound left-turning traffic at Lewis Street due to the inability to easily see past the queuing to observe the large volume of southbound traffic coming from the roundabout in the right lane. It also poses a safety issue for southbound traffic exiting the roundabout with the potential lane changes required to avoid the stopped traffic wishing to turn left at Lewis Street. And finally, it poses a safety issue for pedestrians wishing to cross the south leg of the roundabout.

To address the proximity of the intersection of S. Broadway and Lewis Street with the roundabout at Main Avenue, an analysis was completed for the PM peak with the westbound movement on Lewis Street modified to right-in/right-out only. Background and development traffic were redistributed to surrounding intersections. The analysis shows that all six intersections operate at LOS A during the PM peak period. All movements operate at LOS C or better except for the northbound approach at the intersection of Michigan Street and George Street which operates at a LOS D. Delay for this stop-controlled northbound movement on Michigan Street increased by less than 5 seconds with the additional traffic from the redistribution.

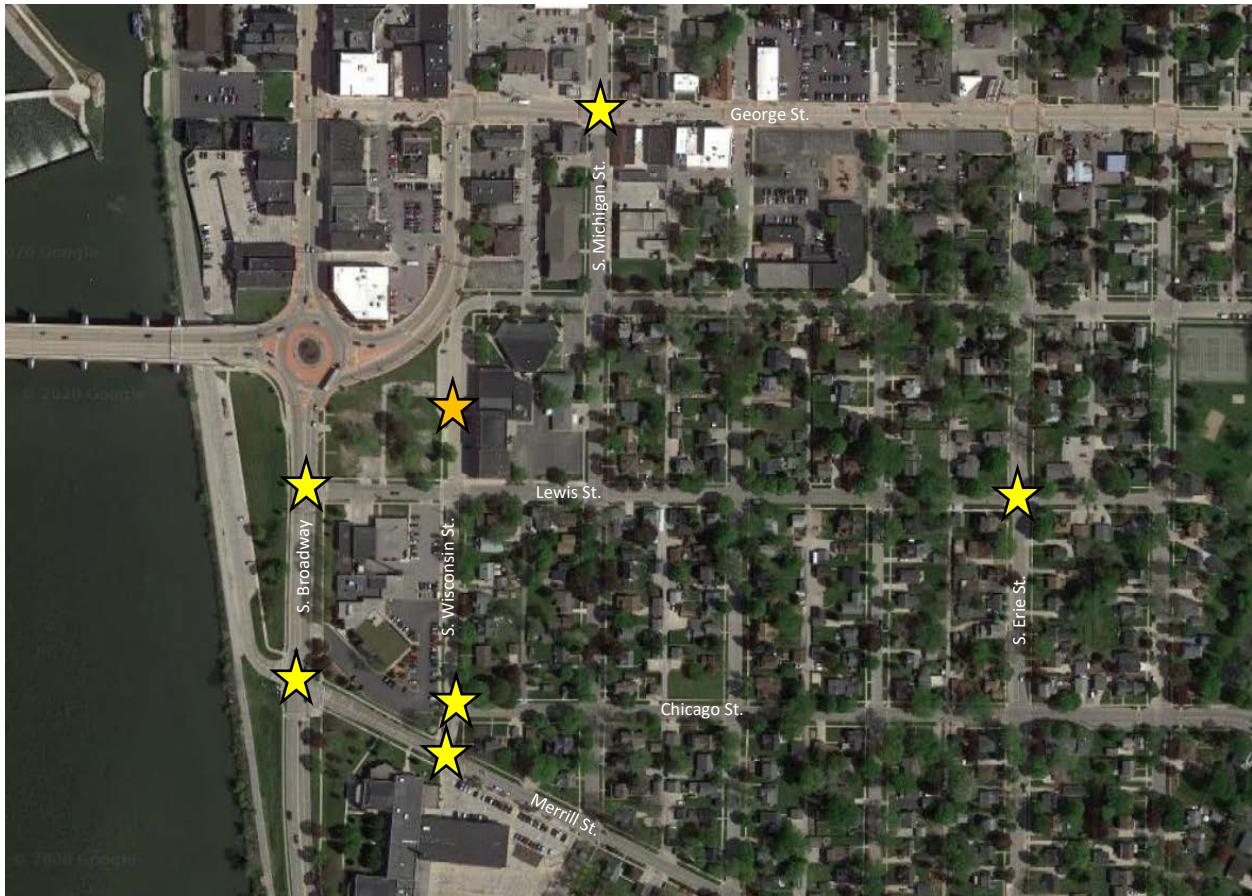

The concept of modifying the westbound movement on Lewis Street to right-in/right-out is recommended. The Miovision video at the intersection of S. Broadway and Lewis Street showed that during peak periods, the westbound movement is already operating as a de facto right-out due to the proximity of Lewis Street to the roundabout at Main Avenue. Drivers are choosing or have learned to avoid attempts at a left-out movement. The overall data shows only one vehicle making a left turn from Lewis Street onto S. Broadway on a weekday between the hours of 11:00 AM – 6:00 PM, none during AM or PM peak times. On Saturday, two vehicles made this left turn between 11:00 AM – 3:00 PM. Making this modification will provide for increased overall network safety by eliminating both the southbound queue and the left turn movements. Left turning vehicles are redistributed to the traffic signal at S. Broadway and Merrill Street to the south or become right turns at the intersection of Michigan Street and George Street resulting in safer access to the desired corridors.

There are no other improvements required to provide LOS D or better for all traffic movements.
